

UC San Diego Battery Fabrication Lab Opening

Ladies and Gentlemen.

My name is Andy from MTI Corporation. Today it is my honor to join in the UC San Diego Battery Fabrication Lab Opening Ceremony. Personally I feel really excited because I participated at every step of the lab setup and installation. We understand that UCSD and MTI Corporation Jiang Family Foundation have already put a lot of effort together on this lab.

I still remember that Prof. Ping visited MTI exhibition booth at ECS meeting last year. It was the first time for Prof. Ping and our President Dr. Xiaoping Jiang to discuss the associated battery fabrication lab. The conversion only took about 15 minutes. We already made the commitment. At that time, we already realized that the winter for the battery research is coming. The resources for the battery research would become saturated. However, we believe that the new generation energy research and innovation would change the world in some day. As a world leader in advanced material and lab equipment manufacturer, MTI Corporation has been servicing the material society for more than 20 years. It is the time for us to make the contribution back. We have a feeling of a great responsibility for the material research society, especially battery research. We have been one part of the material research family. Today, we feel so proud of the lab opening. The opening means that UCSD would carry on the battery research moving forward. And the lab would be opened for all of the researchers and students in UCSD who always get the passion on battery material research and education.

Thank you all for attending the opening ceremony.
